

FORM PTO-1390 (REV 10-94)	U.S. DEPARTMENT OF COMMERCE PATENT AND TRADEMARK OFFICE		DOCKET #: 3397-105PUS
<b>TRANSMITTAL LETTER TO THE UNITED STATES DESIGNATED/ELECTED OFFICE (DO/EO/US) CONCERNING A FILING UNDER 35 U.S.C. 371</b>			
			U.S. APPLICATION NO. (If known, see 37 CFR 1.5) <b>09/936279</b>
INTERNATIONAL APPLICATION NO <b>PCT/FI00/00190</b>		INTERNATIONAL FILING DATE <b>10 March 2000</b>	PRIORITY DATE CLAIMED <b>12 March 1999</b>
TITLE OF INVENTION  <b>Method and Apparatus for Handling a Paper or Board Web</b>			
APPLICANT(S) FOR DO/EO/US  <b>Hannu KORHONEN; Rauno RANTANEN</b>			
Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:			
[x] This is a <b>FIRST</b> submission of items concerning a filing under 35 U.S.C. 371. [ ] This is a <b>SECOND</b> or <b>SUBSEQUENT</b> submission of items concerning a filing under 35 U.S.C. 371 [x] This express request to begin national examination procedures (35 U.S.C. 371(f)) at any time rather than delay examination until the expiration of the applicable time limit set in 35 U.S.C. 371(b) and PCT Articles 22 and 39(i). [x] A proper Demand for International Preliminary Examination was made by the 19th month from the earliest claimed priority date. [x] A copy of the International Application as filed (35 U.S.C. 371(c)(2)) [ ] [x] is transmitted herewith (required only if not transmitted by the International Bureau). b. [ ] has been transmitted by the International Bureau. c. [ ] is not required, as the application was filed in the United States Receiving Office (RO/US) [ ] A translation of the International Application into English (35 U.S.C. 371(c)(2)). [x] Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371(c)(3)) a. [x] are transmitted herewith (required only if not transmitted by the International Bureau). <b>See International Preliminary Examination Report</b> b. [ ] have been transmitted by the International Bureau. c. [ ] have not been made; however, the time limit for making such amendments has NOT expired. d. [ ] have not been made and will not be made. [ ] A translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 371(c)(3)). [x] An oath or declaration of the inventor(s) (35 U.S.C. 371(c)(4)). <b>Unexecuted</b> [ ] A translation of the annexes to the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371(c)(5)).			
<b>Items 11. to 16. Below concern other document(s) or information included:</b>			
11. [x] An Information Disclosure Statement under 37 CFR 1.97 and 1.98. 12. [ ] An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included. 13. [x] A <b>FIRST</b> preliminary amendment. [ ] A <b>SECOND</b> or <b>SUBSEQUENT</b> preliminary amendment. 14. [ ] A substitute specification. 15. [ ] A change of power of attorney and/or address letter. 16. [x] Other items or information ( <i>specify</i> ): PCT Publication Sheet, Int'l Preliminary Examination Report, Reply to Written Opinion (Letter of 19 April 2001), PCT Request, PCT Demand and Notification of the Recording of a Change

Board Web

**PRELIMINARY AMENDMENT**

Assistant Commissioner for Patents

Washington, D.C. 20231

**BOX PCT**

S I R:

Prior to examination of the above-identified application please amend the application as follows:

**IN THE SPECIFICATION:**

Page 1, before line 4, insert the following title:

**--FIELD OF THE INVENTION--**

Page 1, replace the paragraph from line 4 to line 7 with the following paragraph:

--The present invention relates to a method and apparatus for coating webs of paper and board or for surface sizing the same in order to improve their printability, strength or other qualities.--

Page 1, delete the paragraph beginning on line 9.

Page 1, before line 12, insert the following title:

**--BACKGROUND OF THE INVENTION--**

Page 3, replace the three paragraphs from line 17 to line 35 with the following three paragraphs:

--In U.S. Patent No. 3,146,159 is described an embodiment in which application is performed on a wet web by coating one side of the web and simultaneously supporting the web during application from its other side by a fabric. Coating on a calibrating press is also described.

U.S. Patent No. 4,793,899 describes spray-coating and short-dwell application techniques, wherein the web support arrangement is more advanced than that of the above-cited patent, however, not even this embodiment is free from unsupported web travel passages and the applicator still has a web-supporting fabric therein.

U.S. Patent No. 5,152,872, there is described an embodiment free from unsupported web travel passages. In this arrangement, the coating mix is first metered on the outer surfaces of rolls and therefrom directly to the web, yet having a felt running in the nip.--.

Page 3, before line 37 (last line), insert the following title:

**--SUMMARY OF THE INVENTION--**

Page 4, delete lines 33 to 37.

Page 5, delete lines 1 to 2.

Page 6, replace the paragraph from line 9 to line 26 with the following:

--The support belt helps to form a tapering nip between the belt and the web, thus allowing a large amount of surface size to be applied which is advantageous particularly in the manufacture of boxboard. Particularly a shoe press is capable of providing an excellent penetration in the web. Typically a shoe press is also suitable for use in the manufacture of grades having a high bulk and/or improved strength of the paper or board web. By way of applying the surface size on a wet paper or board, the number of hydrogen bonds that principally determine the web strength is increased. Also the swelling of fibers that occurs during the wetting of a dry web is eliminated, whereby the web surface quality is improved. The method according to the invention is suitable for making a great number of paper or board grades with a competitive-edge quality or for producing a base paper of excellent finish for conversion into high-quality coated grades.--.

Page 6, before line 28, insert the following new paragraph and title:

--Other objects and features of the present invention will become apparent from the following detailed description considered in conjunction with the accompanying drawings. It is to be understood, however, that the drawings are intended solely for purposes of illustration and not as a definition of the limits of the invention, for which reference should be made to the appended claims.

**BRIEF DESCRIPTION OF THE DRAWINGS--.**

Page 7, before line 16, insert the following title:

**--DETAILED DESCRIPTION OF THE PRESENTLY PREFERRED EMBODIMENTS--.**

Page 7, line 24 to page 9, line 25, replace the two paragraphs with the following:

--The embodiments shown in FIGS. 1 and 2 are particularly suited for being adapted into a part of the dryer section of a paper- or boardmaking machine when the machine is being rebuilt. In the illustrated embodiment, a coater or surface sizing station is located immediately prior to a dryer cylinder group 1, thus forming an integral part of the press section in the papermaking machine. As the described embodiments are primarily intended to be adapted into the press section during the rebuilding of a papermaking machine, the apparatus will form a part of the press section in the machine. In the embodiment shown in FIG. 1, the web being processed is passed on a felt or wire 2 to the surface sizing/press station. The support element, on which the web is transferred, may be the web-forming wire of the machine or, if the web has already in the preceding steps been dewatered in a press nip, the press felt. The adherence of the web to the support element surface is assured by means of a suction roll 3. From the suction roll, the web is passed to the next support element which is a felt 4. The web transfer from the delivering support element 2 onto the first felt 4 takes place with the help of a suction roll 5. The suction roll 5 presses the first felt 4 against the support element 2, and the vacuum imposed by the roll 5 adheres the web to the felt. The first felt 4 transports the web to a first dewatering nip formed between the first felt 4, a second felt 6, a second suction roll 7 and a backing roll 8. The second suction roll 7 adheres the web to the first felt 4 and, as a result, the web passes over the suction roll 7 supported by the felt 4. Into this station is also positioned a spray applicator S1A for spraying the surface size on the outwardly oriented surface of the

web. Next, the web is passed into a nip formed between the transfer belt 9 and the first felt 4 at a point approximately coincident with the leaving point of the first felt 4 from the perimeter of the second suction roll 7. The transfer belt 9 is a smooth-surface belt made from a metal, advantageously steel, or from a reinforced/nonreinforced rubber or polymer material. A metal belt can be surfaced with a suitable material such as a ceramic coating, for instance. Also polymeric belts may be covered with a ceramic coating, and they may have a fabric-reinforced backing. The transfer belt 9 moves supported by guide rolls and, in the travel direction of the belt, over a backing roll 10 that is mounted in front of the nip between the first felt 4 and the transfer belt 9. At the backing roll 10, there is adapted an applicator device S1B for spreading the surface size on the belt 9. Advantageously, the applicator device S1B is of the same type used as the applicator unit of film-transfer coaters, whereby the surface size is metered and the size is smoothed on the belt surface by means of a rod or blade.

As is shown in FIG. 1, the applicator devices S1A and S1B can be used alternatively or even simultaneously when a large amount of surface size has to be applied to the same surface of the web. Next, the transfer belt 9 with the web travelling thereon is passed into a nip between a deflecting backing roll 11 and a press roll 12, wherein water is removed from the web toward the first felt 4. The transfer belt 9 with the web running thereon passes over the deflecting backing roll 11. In the illustrated embodiment, a shoe press 13 operating against the deflecting backing roll 11 over which a belt or the felt 14 passes. In order to apply surface size to the untreated side of the web, this embodiment has a spray applicator S2 adapted at a point along the web passage between the nip of the press roll 12 and its backing roll 11 and the nip between the shoe press 13 and its backing roll 11. In this arrangement, the first coated side of the web will face the belt 14 that runs over the shoe press 13. If the nip of the shoe press is adapted to have a transfer belt on both sides thereof, no dewatering takes place in the nip, but rather, the press acts as a calender that smooths the web surface.--

Page 10, line 7 to page 11, line 12, replace the two paragraphs with the following:

--In the embodiment shown in the diagram, if the press nip is adapted to operate in conjunction with the wire section, the felt 4 is replaced by a transfer belt, and the roll 5 has no suction facility but instead is advantageously adapted to operate with a backing roll. The coating is

metered with the help of a spray applicator in front of the ingoing side of the nip formed between the roll 5 and its backing roll. In slow machines, the web can be passed directly after the press nip between the rolls 7 and 8 to the cylinder dryer section. In this case, the roll 7 is advantageously a shoe roll, while the roll 8 can be a suction roll.

The embodiment shown in FIG. 2 is otherwise similar to that of FIG. 1 with the exception of having the first dewatering nip and felt removed, while a calibrating press is added. In this embodiment, the spray applicators S1A and S1B may be used alternatively or complementary to each other, and the surface size is applied to the first side of the web by means of an applicator device adapted to operate in conjunction with the transfer belt 9. As a result, the shoe press 13 can be operated with a felt, thus permitting effective water removal toward the uncoated side of the web, whereby the above-mentioned features of good dewatering from the web and size penetration therein are attained. The calibrating press SN is located downstream from the shoe press and comprises two rolls 20, 21 forming a nip therebetween through which the web and its transfer belt 9 pass. The first roll 20 is situated on the interior side of the endless loop of the transfer belt, while the second roll 21 is on its exterior side. An applicator device S2B is adapted to cooperate with the roll 21 located on the exterior side of the endless transfer belt, whereby the roll 21 performs as a film-transfer coater in cooperation with the applicator device S2B. In addition to carrying out the surface sizing, the calibrating press helps to improve the web smoothness in a conventional manner. The calibrating press used in this and other embodiments according to the invention described herein may be replaced by a calender proper, whereby generally two pairs of rolls are needed if the calender rolls comprise a heated hard roll and a soft-covered roll, for instance.--.

Page 13, line 17 to page 14, line 1, replace the paragraph with the following:

--In FIG. 7 is shown an embodiment in which surface sizing is performed at the web-forming wire section, wherein the first dewatering step is performed. Herein, the solids content of the web is still very low. The web enters the treatment device transported by a dryer wire 2 of the paper- or boardmaking machine. On the dryer wire 2, the web is dewatered and its solids content increases. Still transported by the dryer wire, the web enters the shoe press formed by a shoe roll 40 and a backing roll 41. The dryer wire 2 passes over the backing roll 41 and the

transfer belt 39 passes over the shoe roll 40. Thus, the web passes through the shoe press 40, 41 in the nip between the drying wire 2 and the transfer belt 39, whereby the water removal from the web takes place in the direction of the wire 2. In front of the nip formed between the drying wire 2 and the transfer belt 39, there is adapted a spray applicator device 38 suitable for applying a web treatment substance to the web surface. As the web strength due to its high moisture content is low before it enters the shoe press, spray application is a particularly advantageous method of application in this embodiment.--.

Page 16 after line 21 (last line) insert the following new paragraph:

--Thus, while there have been shown and described and pointed out fundamental novel features of the present invention as applied to preferred embodiments thereof, it will be understood that various omissions and substitutions and changes in the form and details of the devices described and illustrated, and in their operation, and of the methods described may be made by those skilled in the art without departing from the spirit of the present invention. For example, it is expressly intended that all combinations of those elements and/or method steps which perform substantially the same function in substantially the same way to achieve the same results are within the scope of the invention. Substitutions of elements from one described embodiment to another are also fully intended and contemplated. It is also to be understood that the drawings are not necessarily drawn to scale but that they are merely conceptual in nature. It is the intention, therefore, to be limited only as indicated by the scope of the claims appended hereto.--.

#### IN THE CLAIMS:

Cancel claims 1 to 46, without prejudice.

Add the following new claims:

47. A method for treating a moving web in a paper- or board-making machine, comprising:

forming a web on a moving wire;

removing water from the web by pressing;

drying the web by at least one dryer cylinder; and

subjecting the web to surface treatment by at least one technique prior to the first dryer cylinder,

wherein the web travels supported by a transfer belt impervious to water during at least one treatment step prior to said first dryer cylinder.

48. The method of claim 47, wherein a web treatment substance is applied to a side of the web during at least one treatment step prior to the first dryer cylinder and the web is arranged to travel supported by a transfer belt so that the side of the web to which the treatment substance is applied is facing the transfer belt, whereby the treatment substance is pressed by the transfer belt onto the web.

49. The method of claim 47, further comprising calendaring at least one side of the web against a transfer belt.

50. The method of claim 47, wherein the web is subjected to a surface treatment while its solids content is in the range of 10 to 60%.

51. The method of claim 47, wherein water is removed from the web in at least one step by pressing the web with the help of an endless felt against the transfer belt by a press element.

52. The method of claim 48, wherein water is removed from the web in at least one step by pressing the web with the help of an endless felt against the transfer belt by a press element.

53. The method of claim 49, wherein water is removed from the web in at least one step by pressing the web with the help of an endless felt against the transfer belt by a press element.

54. The method of claim 51, wherein the web is pressed by a felt against the transfer belt in a shoe press.

55. The method of claim 51, wherein the web is pressed by a felt by pressing it against a transfer belt by a roll.

56. The method of claim 47, wherein water is removed from the web by a noncontacting dryer prior to the first dryer cylinder.

57. The method of claim 47, wherein the web is conveyed, at least when it is dewatered, under pressing in continuous contact with at least one endless support element.

58. The method of claim 57, wherein the endless support element comprises one of a wire, a felt and a transfer belt.

59. The method of claim 47, wherein the web treatment substance is applied to the surface of the transfer belt by one of a film-transfer applicator device, a spray applicator, a jet applicator, and a short-dwell applicator, whereby the treatment substance is applied to the web as a film which travels on the surface of the transfer belt.

60. The method of claim 48, wherein the web treatment substance is applied to the surface of the transfer belt by one of a film-transfer applicator device, a spray applicator, a jet applicator, and a short-dwell applicator, whereby the treatment substance is applied to the web as a film which travels on the surface of the transfer belt.

61. The method of claim 47, wherein the web treatment substance is applied in at least one step directly to the web surface by a spray applicator.

62. The method of claim 57, wherein the web treatment substance is applied in at least one step directly to the web surface by a spray applicator.

63. The method according to claim 47, wherein the web treatment substance is applied directly into a nip formed between the transfer belt and the web.

64. The method according to claim 57, wherein the web treatment substance is applied directly into a nip formed between the transfer belt and the web.

65. The method of claim 47, wherein the web treatment substance is applied to the transfer belt.

66. The method of claim 65, wherein the web treatment substance is further applied directly to the web in an amount so as to form a pond substantially where the web and the transfer belt contact.

67. The method of claim 63, wherein the web treatment substance is applied to the transfer belt.

68. The method of claim 67, wherein the web treatment substance is further applied directly to the web in an amount so as to form a pond substantially where the web and the transfer belt contact.

69. The method of claim 47, wherein the web is treated in a calibrating press prior to passing the web to the first dryer cylinder.

70. The method of claim 69, wherein the transfer belt is passes through a nip of the calibrating press.

71. The method of claim 69, wherein the web is treated in a calibrating press having a nip formed by two rolls, wherein the treatment substance is applied to one roll of the calibrating press by an applicator device and the treatment substance is subsequently transferred from the surface of the roll to the web.

72. The method of claim 70, wherein the web is treated in a calibrating press having a nip formed by two rolls, wherein the treatment substance is applied to one roll of the

calibrating press by an applicator device and the treatment substance is subsequently transferred from the surface of the roll to the web.

73. The method of claim 70, wherein the web is treated in a calibrating press having a nip formed by two rolls and a belt running about one of said rolls, wherein the treatment substance is applied to the surface of the belt of the calibrating press by an applicator device and the treatment substance is subsequently transferred from the surface of the belt to the web.

74. The method according to claim 70, wherein the web is treated in a calibrating press having a nip formed by a roll and a shoe roll having a belt running about the roll, wherein the treatment substance is applied to a surface of the belt of the calibrating press by an applicator device and the treatment substance is subsequently transferred from the surface of the belt to the web.

75. The method of claim 48, wherein the web is passes through a nip formed by two transfer belts pressable against each other, wherein the treatment substance is applied to the surfaces of both belts and the treatment substance is subsequently transferred to both surfaces of the web.

76. The method of claim 47, wherein the web is supported at least partially during dewatering by one of a felt, a belt, a roll, a cylinder, an air blow support means, and a vacuum support means.

77. The method of claim 47, wherein the web is dried after application of the treatment substance during the first treatment step by means of a noncontacting dryer.

78. The method of claim 77, wherein the noncontacting dryer comprises one of a radiant heat dryer and an air-impingement dryer.

79. The method of claim 56, wherein the web is dried after application of the treatment substance during the first treatment step by means of a noncontacting dryer.

80. The method of claim 57, wherein the web is dried after application of the treatment substance during the first treatment step by means of a noncontacting dryer.

81. The method of claim 59, wherein the web is dried after application of the treatment substance during the first treatment step by means of a noncontacting dryer.

82. The method of claim 61, wherein the web is dried after application of the treatment substance during the first treatment step by means of a noncontacting dryer.

83. The method of claim 63, wherein the web is dried after application of the treatment substance during the first treatment step by means of a noncontacting dryer.

84. The method of claim 65, wherein the web is dried after application of the treatment substance during the first treatment step by means of a noncontacting dryer.

85. The method of claim 76, wherein the web is dried after application of the treatment substance during the first treatment step by means of a noncontacting dryer.

86. The method of claim 47, wherein at least two layers of treatment substance are applied at least to one side of the web during at least two separate web treatment steps.

87. The method of claim 59, wherein at least two layers of treatment substance are applied at least to one side of the web during at least two separate web treatment steps.

88. The method of claim 61, wherein at least two layers of treatment substance are applied at least to one side of the web during at least two separate web treatment steps.

89. The method of claim 63, wherein at least two layers of treatment substance are applied at least to one side of the web during at least two separate web treatment steps.

90. The method of claim 65, wherein at least two layers of treatment substance are applied at least to one side of the web during at least two separate web treatment steps.

91. The method of claim 69, wherein at least two layers of treatment substance are applied at least to one side of the web during at least two separate web treatment steps.

92. The method of claim 76, wherein at least two layers of treatment substance are applied at least to one side of the web during at least two separate web treatment steps.

93. The method of claim 47, wherein at least one layer of a web treatment substance is applied to the web by means of a film-transfer roll.

94. The method of claim 59, wherein at least one layer of a web treatment substance is applied to the web by means of a film-transfer roll.

95. The method of claim 86, wherein at least one layer of a web treatment substance is applied to the web by means of a film-transfer roll.

96. The method of claim 47, wherein the web treatment substance comprises one of surface size and coating mix in the form of one of a liquid, a dispersion, an emulsion and a foam.

97. The method of claim 47, wherein the web is pressed against a roll by a transfer belt.

98. An apparatus for a paper- or board-making machine comprising:

- a wire section for forming a moving web of paper or board;
- a dryer means for removing water from the web by pressing;

at least one dryer cylinder for drying the web;

at least one surface treatment device for treating the surface of the web prior to the first dryer cylinder; and

at least one transfer belt that is impervious to water and that forms an endless loop against which the web is arranged to travel while the surface of the web is treated by the surface treatment device.

99. The apparatus of claim 98, further comprising a means for applying a treatment substance to the web surface facing a transfer belt in a manner that causes the applied substance to be pressed into the web by said belt.

100. The apparatus of claim 98, wherein at least one of the surface treatment devices is a calender.

101. The apparatus of claim 99, wherein at least one of the surface treatment devices is a calender.

102. The apparatus of claim 98, further comprising:  
a felt positioned to travel against said transfer belt so that the web to be treated is passed between the felt and the transfer belt; and  
at least one pressing means for pressing the felt against the transfer belt for removing water from the web by pressing.

103. The apparatus of claim 102, wherein said pressing means is a shoe press.

104. The apparatus of claim 102, wherein said pressing means is a roll.

105. The apparatus of claim 99, further comprising at least one noncontacting dryer means used for drying the web prior to the first dryer cylinder.

106. The apparatus of claim 98, wherein said wire section comprises a web-forming wire, and further comprising at least one felt, wire and belt, and a means for picking the web off the web-forming wire of said wire section and passing the web supported by the at least one felt, wire and belt to a next belt, felt or wire.

107. The apparatus of claim 106, further comprising a wire passing about said dryer cylinder, and a means for picking the web off said transfer belt and passing the web at least partially supported by said wire to said dryer cylinder.

108. The apparatus of claim 107, further comprising at least one felt and at least one transfer belt positioned to pass the web in a continuously supported manner and in continuous connection with said transfer belt through said dryer means.

109. The apparatus of claim 98, further comprising a means for applying a web treatment substance to a surface of the transfer belt.

110. The apparatus of claim 109, wherein said means for applying a web treatment substance to a surface of the transfer belt comprises one of a film-transfer applicator, a spray applicator, a jet applicator, and a short-dwell applicator device.

111. The apparatus of claim 98, further comprising at least one spray applicator device located proximate the dryer means for applying a web treatment substance to one of the web, and a nip formed by the web and the transfer belt.

112. The apparatus of claim 98, further comprising a calibrating press located in front of said dryer cylinder.

113. The apparatus of claim 98, further comprising a calender through which the web is adapted to pass prior to passing to said dryer cylinder.

114. The apparatus of claim 112, wherein said transfer belt passes through the calibrating press.

115. The apparatus of claim 114, further comprising a roll located on the exterior side of said transfer belt of the calibrating press, and a means for applying a web treatment substance on said roll located on the exterior side of the endless-loop transfer belt of the calibrating press.

116. The apparatus of claim 112, further comprising a belt positioned to pass as an endless loop over said roll located on the exterior side of said transfer belt, and a means for applying a web treatment substance on the surface of said belt positioned to pass over said roll located on the exterior side of said transfer belt.

117. The apparatus of claim 114, further comprising a belt positioned to pass as an endless loop over said roll located on the exterior side of said transfer belt, and a means for applying a web treatment substance on the surface of said belt positioned to pass over said roll located on the exterior side of said transfer belt.

118. The apparatus of claim 116, wherein said calibrating press comprises a shoe press.

119. The apparatus of claim 117, wherein said calibrating press comprises a shoe press.

120. The apparatus of claim 98, further comprising:  
at least two transfer belts positioned to move at least a portion of their travel opposed to each other so that the web is passed therebetween;  
a means for applying a web treatment substance to the surfaces of said transfer belts;  
and  
a means for pressing said transfer belts against each other for setting up an application pressure.

121. The apparatus of claim 98, further comprising at least one noncontacting dryer to dry the web after the application of the web treatment substance.

122. The apparatus of claim 109, further comprising at least one noncontacting dryer to dry the web after the application of the web treatment substance.

123. The apparatus of claim 111, further comprising at least one noncontacting dryer to dry the web after the application of the web treatment substance.

124. The apparatus of claim 115, further comprising at least one noncontacting dryer to dry the web after the application of the web treatment substance.

125. The apparatus of claim 120, further comprising at least one noncontacting dryer to dry the web after the application of the web treatment substance.

126. The apparatus of claim 98, further comprising at least one film-transfer roll for applying a web treatment substance to the web surface.

127. The apparatus of claim 98, further comprising a roll and wherein at least one transfer belt is positioned to pass over said roll such that the web is pressed by the transfer belt against the roll.

#### **REMARKS**

This preliminary amendment is presented to place the application in proper form for examination and to eliminate multiple dependency from the present claims. No new matter has been added. Early examination and favorable consideration of the above-identified application is earnestly solicited.

Any additional fees or charges required at this time in connection with the application may be charged to our Patent and Trademark Office Deposit Account No. 03-2412.

Respectfully submitted,

## AMENDMENTS TO THE APPLICATION

Page 1, the paragraph beginning on line 4 has been amended as follows:

--The present invention relates to a method [according to the preamble of claim 1] and apparatus for coating webs of paper and board or for surface sizing the same in order to improve their printability, strength or other qualities.--

Page 3, the three paragraphs from line 17 to line 35 have been amended as follows:

-- In [US Pat.] U.S. Patent No. 3,146,159 is described an embodiment in which application is performed on a wet web by coating one side of the web and simultaneously supporting the web during application from its other side by a fabric. Coating on a calibrating press is also described.

[US Pat.] U.S. Patent No. 4,793,899 describes spray-coating and short-dwell application techniques, wherein the web support arrangement is more advanced than that of the above-cited patent, however, not even this embodiment [being] is free from unsupported web travel passages and the applicator still [having] has a web-supporting fabric therein.

[Further referring to US Pat.] U.S. Patent No. 5,152,872, there is described an embodiment free from unsupported web travel passages. In this arrangement, the coating mix is first metered on the outer surfaces of rolls and therefrom directly to the web, yet having a felt running in the nip.--.

Page 6, the paragraph from line 9 to line 26 has been amended as follows:

-- The support belt helps to form a tapering nip between the belt and the web, thus allowing a large amount of surface size to be applied which is advantageous particularly in the manufacture of boxboard. Particularly a shoe press is capable of providing an excellent penetration in the web. Typically a shoe press is also suitable [of being used] for use in the manufacture of grades having a high bulk and/or improved strength of the paper or board web. By way of applying the surface size on a wet paper or board, the number of hydrogen bonds that principally determine the web strength is increased. Also the swelling of fibers that occurs during the wetting of a dry web is eliminated, whereby the web surface quality is improved.

The method according to the invention is suitable for making a great number of paper or board grades with a competitive-edge quality or for producing a base paper of excellent finish for conversion into high-quality coated grades.--.

Page 7, line 24 to page 9, line 25, the two paragraphs have been amended as follows:

--The embodiments shown in FIGS. 1 and 2 are particularly suited for being adapted into a part of the dryer section of a paper- or boardmaking machine when the machine is being rebuilt. In the illustrated embodiment, a coater or surface sizing station is located immediately prior to a dryer cylinder group 1, thus forming an integral part of the press section in the papermaking machine. As the described embodiments are primarily intended to be adapted into the press section during the rebuilding of a papermaking machine, the apparatus will form a part of the press section in the machine. In the embodiment shown in FIG. 1, the web being processed is passed on a felt or wire 2 to the surface sizing/press station. The support element, on which the web is transferred, may be the web-forming wire of the machine or, if the web has already in the preceding steps been dewatered in a press nip, the press felt. The adherence of the web to the support element surface is assured by means of a suction roll 3. From the suction roll, the web is passed to the next support element which is a felt 4. The web transfer from the delivering support element 2 onto the first felt 4 takes place with the help of a suction roll 5. The suction roll 5 presses the first felt 4 against the support element 2, and the vacuum imposed by the roll 5 adheres the web to the felt. The first felt 4 [transport] transports the web to a first dewatering nip formed between the first felt 4, a second felt 6, a second suction roll 7 and a backing roll 8. The second suction roll 7 adheres the web to the first felt 4 and, [resultingly] as a result, the web passes over the suction roll 7 supported by the felt 4. Into this station is also [adapted] positioned a spray applicator S1A [suited] for spraying the surface size on the outwardly oriented surface of the web. Next, the web is passed into a nip formed between the transfer belt 9 and the first felt 4 at a point approximately coincident with the leaving point of the first felt 4 from the perimeter of the second suction [felt] roll 7. The transfer belt 9 is a smooth-surface belt made from a metal, advantageously steel, or from a reinforced/nonreinforced rubber or polymer material. A metal belt can be surfaced with a suitable material such as a ceramic coating, for instance. Also polymeric belts may be covered with a ceramic coating, and they may have a fabric-reinforced backing. The transfer belt 9 moves supported by guide rolls and, in the travel direction of the belt, over a backing roll 10

that is mounted in front of the nip between the first felt 4 and the transfer belt 9. At the backing roll 10, there is adapted an applicator device S1B for spreading the surface size on the belt 9. Advantageously, the applicator device S1B is of the same type used as the applicator unit of film-transfer coaters, whereby the surface size is metered and the size is smoothed on the belt surface by means of a rod or blade.

As is shown in FIG. 1, the applicator devices S1A and S1B can be used alternatively or even simultaneously when a large amount of surface size has to be applied to the same surface of the web. Next, the transfer belt 9 with the web travelling thereon is passed into a nip between a deflecting backing roll 11 and a press roll 12, wherein water is removed from the web toward the first felt 4. The transfer belt 9 with the web running thereon passes over the deflecting backing roll 11. In the illustrated embodiment, a shoe press 13 [adapted to operate] operating against the deflecting backing roll 11 over which a belt or the felt 14 [is adapted to pass] passes. In order to apply surface size to the untreated side of the web, this embodiment has a spray applicator S2 adapted at a point along the web passage between the nip of the press roll 12 and its backing roll 11 and the nip between the shoe press 13 and its backing roll 11. In this arrangement, the first coated side of the web will face the belt 14 that runs over the shoe press 13. If the nip of the shoe press is adapted to have a transfer belt on both sides thereof, no dewatering takes place in the nip, but rather, the press acts as a calender that smooths the web surface.--.

Page 10, line 7 to page 11, line 12, the two paragraphs have been amended as follows:

--In the embodiment shown in the diagram, if the press nip is adapted to operate in conjunction with the wire section, the felt 4 is replaced by a transfer belt, and the roll 5 has no suction facility but instead is advantageously adapted to operate with a backing roll. The coating is metered with the help of a spray applicator in front of the ingoing side of the nip formed between the roll 5 and its backing roll. In slow machines, the web can be passed directly after the press nip between the rolls 7 and 8 to the cylinder dryer section. In this case, the roll 7 is advantageously a shoe roll, while the roll 8 can be a suction roll.

The embodiment shown in FIG. 2 is otherwise similar to that of FIG. 1 with the exception of having the first dewatering nip and felt removed, while a calibrating press is added. In this

embodiment, the spray applicators S1A and S1B may be used alternatively or complementary to each other, and the surface size is applied to the first side of the web by means of an applicator device adapted to operate in conjunction with the transfer belt 9. [Resultingly] As a result, the shoe press 13 can be operated with a felt, thus permitting effective water removal toward the uncoated side of the web, whereby the above-mentioned features of good dewatering from the web and size penetration therein are attained. The calibrating press SN is located downstream from the shoe press and comprises two rolls 20, 21 forming a nip therebetween through which the web and its transfer belt 9 [are adapted to] pass. The first roll 20 is situated on the interior side of the endless loop of the transfer belt, while the second roll 21 is on its exterior side. An applicator device S2B is adapted to cooperate with the roll 21 located on the exterior side of the endless transfer belt, whereby the roll 21 performs as a film-transfer coater in cooperation with the applicator device S2B. In addition to carrying out the surface sizing, the calibrating press helps to improve the web smoothness in a conventional manner. The calibrating press used in this and other embodiments according to the invention described herein may be replaced by a calender proper, whereby generally two pairs of rolls are needed if the calender rolls comprise a heated hard roll and a soft-covered roll, for instance.--.

Page 13, line 17 to page 14, line 1, the paragraph has been amended as follows:

--In FIG. 7 is shown an embodiment in which surface sizing is performed at the web-forming wire section, wherein the first dewatering step is performed. Herein, the solids content of the web is still very low. The web enters the treatment device transported by a dryer wire 2 of the paper- or boardmaking machine. On the dryer wire 2, the web is dewatered and its solids content increases. Still transported by the dryer wire, the web enters the shoe press formed by a shoe roll 40 and a backing roll 41. The dryer wire 2 passes over the backing roll 41 and the transfer belt 39 passes over the shoe roll 40. Thus, the web passes through the shoe press 40, 41 in the nip between the drying wire 2 and the transfer belt 39, whereby the water removal from the web takes place in the direction of the wire 2. In front of the nip formed between the drying wire 2 and the transfer belt 39, there is adapted a spray applicator device 38 suitable for applying a web treatment substance to the web surface. As the web strength due to its high moisture content is low before it enters the shoe press, spray application is a particularly advantageous method of application in this embodiment.--.

# Method and apparatus for handling a paper or board web

5 The present invention relates to a method according to the preamble of claim 1 for coating webs of paper and board or for surface sizing the same in order to improve their printability, strength or other qualities.

10 The invention also relates to an assembly suited for implementing said method.

15 In order to improve the qualities of a paper or board sheet, the base web of the paper or board sheet is treated in different ways. The goal of each treatment is to improve the strength or printability properties of the produced grade. Strength improvement is principally accomplished by way of surface sizing, wherein the web surface is coated with a strength-improving sizing agent such as a starch solution. Coating is applied, among  
20 other reasons, for such purposes as better product brightness, surface impermeability or smoothness, while calendering serves to improve the surface smoothness and gloss.

25 Conventionally, web treatment is performed after base web formation so that a dry web is treated in separate off-line equipment or, alternatively, in online equipment connected directly after the paper- or boardmaking machine. Herein, the web is dried at least essentially  
30 close to its final degree of moisture content, whereby the web must be moistened and redried particularly during surface sizing and coating, which increases the machine length and energy consumption. As modern paper/board-making machines are already equipped with efficient  
35 dewatering and drying sections, it would be advantageous to have the web-wetting operations such as surface sizing and coating moved as close as possible to the headbox so

as to take place within the wire section or press section, whereby the dewatering and drying of the base sheet having the surface treatment agent applied thereto can be accomplished at least partially simultaneously.

5 Surface sizing and coating performed at the press or wire section would also offer substantial quality benefits inasmuch the penetration of the surface sizing agent into the web takes place in a manner entirely different from that when the treatment agent causing web wetting is

10 applied to an already dried base sheet. The quality of calendering is improved if this step is carried out on a web of higher moisture content, whereby also the outcome of calendering for the most common paper and board grades would benefit from being performed at the press section

15 of a paper/boardmaking machine.

The history of having the base sheet formation and finishing phases chained in two separate steps can be traced to two major factors. Firstly, the formation of

20 the base sheet and its subsequent finishing have traditionally been considered extremely autonomous production phases to be implemented independently from each other. Secondly, paper webs in particular and even board webs are very fragile prior to their drying close to the final

25 solids content, whereby it has not been possible to execute such treatments that cause wetting of the web without jeopardizing web runnability.

From the art is known an embodiment in which surface

30 sizing is carried out using a film-transfer applicator. In a film-transfer application apparatus, a coating film metered very accurately on a rotating film-transfer roll is transferred from the roll to the surface of the running web. Although a film-transfer applicator offers

35 very good runnability and causes a minimal stress on the web, the water permeating the web anyhow weakens its strength. Since the web will not be passed directly from

the film-transfer roll onto a supporting element such as a wire, an unsupported gap remains between the film-transfer roll and the subsequent supporting element. Hence, the web is always subjected to stresses in the cross-machine direction and particularly in the machine direction. For instance, variations in the moisture content profile may cause stress peaks on the web that readily break the wet and fragile web.

10 In addition to the technique of film-transfer application, use of spray application has been proposed in the art, wherein the surface size or coating mix is applied to the web by means of an array of spraying nozzles staggered in the cross-machine and/or the machine direction.

15 In US Pat. No. 3,146,159 is described an embodiment in which application is performed on a wet web by coating one side of the web and simultaneously supporting the web during application from its other side by a fabric. Coating on a calibrating press is also described.

US Pat. No. 4,793,899 describes spray-coating and short-dwell application techniques, wherein the web support arrangement is more advanced than that of the above-cited patent, however, not even this embodiment being free from unsupported web travel passages and the applicator still having a web-supporting fabric therein.

25 Further referring to US Pat. No. 5,152,872, there is described an embodiment free from unsupported web travel passages. In this arrangement, the coating mix is first metered on the outer surfaces of rolls and therefrom directly to the web, yet having a felt running in the nip.

35 It is an object of the present invention to provide a

method suited for treating a paper or board web with a wetting substance or, alternatively, calendering the web prior to the cylinder dryer section of a paper- or board-making machine meanwhile the solids content of the web is  
5 still very low, typically 10 - 60 %.

It is a further object of the invention to provide a method in which the web can be passed fully supported from the wire section of the paper- or boardmaking  
10 machine, when desired, up to the winder, thus utilizing the quality improvement benefits offered by a controlled management of web moisture content and wetting.

The goal of the invention is achieved by way of passing the web supported by a transfer belt through at least one  
15 surface treatment section such as a coater station or a calender prior to taking the web to the first dryer cylinder group of the paper- or boardmaking machine.

According to one advantageous embodiment of the invention, at least one nip supported by the web-transferring belt is used for dewatering simultaneously with the application of a web treatment agent to the web. The dewatering nip may be formed between a transfer belt  
20 and the wire of the wire section or the felt of the press section of the machine. As a matter of convenience, dewatering in a nip between the transfer belt and the wire is defined to comprise a portion of the press section, whereby reference to a nip of the press section  
25 in the following text may also be understood to include a nip formed between a wire and a web transfer belt.  
30

More specifically, the method according to the invention is characterized by what is stated in the characterizing  
35 part of claim 1.

Furthermore, the assembly according to the invention is

characterized by what is stated in the characterizing part of claim 26.

The invention offers significant benefits.

5

One of the most important benefits of the invention is that the invention allows a coated or surface-sized board or paper to be manufactured in a machine of vastly simplified or shorter construction over those known in the prior art, because the web surface treatment and drying steps can be carried out in a single or almost single space and with the same equipment that in the prior art served for dewatering on the press section and the dryer. Accordingly, the machinery is principally comprised of existing sections. If the machinery is equipped with a calender section, it may be located at the most advantageous point along the line in respect to the web moisture content and treatability of the paper grade being manufactured. The efficiency of the web drying process is improved, because drying can be performed only once without the need for rewetting an already dried web. Water removal is also performed more cost-effectively from a very wet web than from a dry web. If the surface sizing or coating application step is carried out, e.g., in the press section nip so that the web is supported from the side to be treated by the transfer belt and from the other side by a felt or wire, water is removed from the web toward the felt or the wire, thus allowing the treatment substance to penetrate into the web. In the best case, the entire volume of water corresponding to that of the treatment substance is subsided from the wet web into the felt, whereby the drying capacity needed for web dewatering is not increased. In this manner, the invention can provide so good a web surface smoothness that soft-calendered qualities of paper or board can be made with an acceptable quality. Water transport and removal as well as the

35

calendering effect may be augmented by heating the web transfer belt or its support roll. By means of a heated belt, it is possible to control the temperature profile of the web, whereby the moisture content or smoothness profile of the web, for instance, may be varied. Additionally, the adjustment of the size metering can be used for controlling the moisture content profile.

The support belt helps to form a tapering nip between the belt and the web, thus allowing a large amount of surface size to be applied which is advantageous particularly in the manufacture of boxboard. Particularly a shoe press is capable of providing an excellent penetration in the web. Typically a shoe press is also suitable of being used in the manufacture of grades having a high bulk and/or improved strength of the paper or board web. By way of applying the surface size on a wet paper or board, the number of hydrogen bonds that principally determine the web strength is increased. Also the swelling of fibers that occurs during the wetting of a dry web is eliminated, whereby the web surface quality is improved. The method according to the invention is suitable for making a great number of paper or board grades with a competitive-edge quality or for producing a base paper of excellent finish for conversion into high-quality coated grades.

In the following, the invention will be examined in greater detail by making reference to the appended drawings in which

FIG. 1 shows schematically a first embodiment of the invention;

FIG. 2 shows schematically a second embodiment of the invention;

FIG. 3 shows schematically a third embodiment of the invention;

5 FIG. 4 shows schematically a fourth embodiment of the invention;

FIG. 5 shows schematically a fifth embodiment of the invention;

10 FIG. 6 shows schematically a sixth embodiment of the invention; and

FIG. 7 shows schematically a seventh embodiment of the invention.

15

In the following description, a surface sizing process adapted to operate in different manners in conjunction with the press section of a papermaking machine is elaborated by way of example. Obviously, the same or  
20 essentially similar embodiments can be used in a boardmaking machine and others serving to apply a coating or other treatment substance on the surface of a web.

The embodiments shown in FIGS. 1 and 2 are particularly  
25 suited for being adapted into a part of the dryer section of a paper- or boardmaking machine when the machine is being rebuilt. In the illustrated embodiment, a coater or surface sizing station is located immediately prior to a dryer cylinder group 1, thus forming an integral part of  
30 the press section in the papermaking machine. As the described embodiments are primarily intended to be adapted into the press section during the rebuilding of a papermaking machine, the apparatus will form a part of the press section in the machine. In the embodiment shown  
35 in FIG. 1, the web being processed is passed on a felt or wire 2 to the surface sizing/press station. The support element, on which the web is transferred, may be the web-

forming wire of the machine or, if the web has already in the preceding steps been dewatered in a press nip, the press felt. The adherence of the web to the support element surface is assured by means of a suction roll 3.

5 From the suction roll, the web is passed to the next support element which is a felt 4. The web transfer from the delivering support element 2 onto the first felt 4 takes place with the help of a suction roll 5. The suction roll 5 presses the first felt 4 against the  
10 support element 2, and the vacuum imposed by the roll 5 adheres the web to the felt. The first felt 4 transports the web to a first dewatering nip formed between the first felt 4, a second felt 6, a second suction roll 7 and a backing roll 8. The second suction roll 7 adheres  
15 the web to the first felt 4 and, resultingly, the web passes over the suction roll 7 supported by the felt 4. Into this station is also adapted a spray applicator S1A suited for spraying the surface size on the outwardly oriented surface of the web. Next, the web is passed into  
20 a nip formed between the transfer belt 9 and the first felt 4 at a point approximately coincident with the leaving point of the first felt from the perimeter of the second suction felt 7. The transfer belt 9 is a smooth-surface belt made from a metal, advantageously steel, or  
25 from a reinforced/nonreinforced rubber or polymer material. A metal belt can be surfaced with a suitable material such as a ceramic coating, for instance. Also polymeric belts may be covered with a ceramic coating, and they may have a fabric-reinforced backing. The transfer  
30 belt 9 moves supported by guide rolls and, in the travel direction of the belt, over a backing roll 10 that is mounted in front of the nip between the first felt 4 and the transfer belt 9. At the backing roll 10, there is adapted an applicator device S1B for spreading the  
35 surface size on the belt 9. Advantageously, the applicator device is of the same type used as the applicator unit of film-transfer coaters, whereby the surface size

is metered and the size is smoothed on the belt surface by means of a rod or blade.

As is shown in FIG. 1, the applicator devices S1A and S1B  
5 can be used alternatively or even simultaneously when a large amount of surface size has to be applied to the same surface of the web. Next, the transfer belt 9 with the web travelling thereon is passed into a nip between a deflecting backing roll 11 and a press roll 12, wherein  
10 water is removed from the web toward the first felt 4. The transfer belt 9 with the web running thereon passes over the deflecting backing roll 11. In the illustrated embodiment, a shoe press 13 adapted to operate against the deflecting backing roll 11 over which a belt or the  
15 felt 14 is adapted to pass. In order to apply surface size to the untreated side of the web, this embodiment has a spray applicator S2 adapted at a point along the web passage between the nip of the press roll 12 and its backing roll 11 and the nip between the shoe press 13 and  
20 its backing roll. In this arrangement, the first coated side of the web will face the belt 14 that runs over the shoe press 13. If the nip of the shoe press is adapted to have a transfer belt on both sides thereof, no dewatering takes place in the nip, but rather, the press acts as a  
25 calender that smooths the web surface.

From the shoe press 13, the web travels on the transfer belt 9 out from the shoe press nip. The web is picked from the transfer belt 9 onto the dryer wire 15 of the  
30 dryer cylinder group by a third suction roll 16. Adherence of the web to the felt is secured by means of a suction box 17, and the final drying of the web is carried out by means a dryer cylinder group 1, whereupon the web

is wound into machine rolls or, alternatively, is taken to further processing at finishing equipment connected to the paper- or boardmaking machine. After the web has left the transfer belt 9, the belt can be cleaned if necessary with the help of water jets 18 and a scraper 19.

In the embodiment shown in the diagram, the press nip is adapted to operate in conjunction with the wire section, the felt 4 is replaced by a transfer belt, and the roll 5 has no suction facility but instead is advantageously adapted to operate with a backing roll. The coating is metered with the help of a spray applicator in front of the ingoing side of the nip formed between the roll 5 and its backing roll. In slow machines, the web can be passed directly after the press nip between the rolls 7 and 8 to the cylinder dryer section. In this case, the roll 7 is advantageously a shoe roll, while the roll 8 can be a suction roll.

The embodiment shown in FIG. 2 is otherwise similar to that of FIG. 1 with the exception of having the first dewatering nip and felt removed, while a calibrating press is added. In this embodiment, the spray applicators S1A and S1B may be used alternatively or complementary to each other, and the surface size is applied to the first side of the web by means of an applicator device adapted to operate in conjunction with the transfer belt 9. Resultingly, the shoe press 13 can be operated with a felt, thus permitting effective water removal toward the uncoated side of the web, whereby the above-mentioned features of good dewatering from the web and size penetration therein are attained. The calibrating press SN is located downstream from the shoe press and comprises two rolls 20, 21 forming a nip therebetween through which the web and its transfer belt 9 are adapted to pass. The first roll 20 is situated on the interior side of the endless loop of the transfer belt, while the second roll

21 is on its exterior side. An applicator device S2B is adapted to cooperate with the roll 21 located on the exterior side of the endless transfer belt, whereby the roll 21 performs as a film-transfer coater in cooperation with the applicator device S2B. In addition to carrying out the surface sizing, the calibrating press helps to improve the web smoothness in a conventional manner. The calibrating press used in this and other embodiments according to the invention described herein may be replaced by a calender proper, whereby generally two pairs of rolls are needed if the calender rolls comprise a heated hard roll and a soft-covered roll, for instance.

In FIG. 3 is shown an apparatus layout comprising two shoe presses. This embodiment may also be implemented using roll presses instead of shoe presses. As above, the web is again received from the preceding treatment section onto a wire 2 and then passed over a first suction roll 5 to a first felt 4. The first felt 4 travels via a first shoe press 22. The shoe press 22 is situated on the interior side of the endless loop of the first felt 4 and is pressed against a backing roll 26 about which another felt 27 passes. As this shoe press only serves to dewater the web, it is advantageous to have a felt adapted to both sides of the web. From the nip of the first shoe press 22, the web is transferred onto the second felt 27 and, in the downstream direction of the web travel after the shoe press 22, there is located a spray applicator unit S1 for applying surface size on the web side that is opposite to the web side facing the second felt 27. From the second felt 27, the web is transferred onto a third felt 31 by means of a suction roll 28 and next in the downstream direction of the web travel there is located a spray applicator unit S2A serving to apply coating to the web surface. In the downstream direction of the web travel is next located a second shoe press 29 having a third felt 31 and a transfer belt 32 adapted to pass

through its nip. The transfer belt passes over the backing roll 30 of the shoe press 29 and further over the applicator unit backing roll 33. At the applicator unit backing roll 33, to the exterior side of the endless transfer belt is adapted an applicator device S2B. Also  
5      herein, the applicator devices S2A and S2B may be operated in an alternative or complementary manner.

The embodiment shown in FIG. 4 is otherwise similar to that of FIG. 3 with the exception of a calibrating press SN which is added to the system for applying the surface size in lieu of the first press nip. Also the illustrated layout has an applicator device S2 adapted to cooperate with the roll 21 that is located on the exterior side of  
10      the calibrating press SN and, additionally, the diagram shows cleaning means 34 adapted about the exterior roll, that is, the applicator roll. Also the belt 32 may have cleaning means not shown herein. In FIG. 4 are also illustrated suction boxes 36 at the points where the web  
15      is transferred onto the next felt with the help of suction boxes. The suction boxes serve to assure the adherence of the web to the felt. In the downstream direction of the web travel, prior to the second shoe press, there is adapted a blow-down box, a dryer or a  
20      measurement device designated in the diagram as unit 37. The first applicator device is adapted to cooperate with the transfer belt 32, and the other side of the web is treated on the second roll 21 of the calibrating press SN and the applicator device S2 adapted to cooperate  
25      therewith.  
30

In the embodiment shown in FIG. 5, the calibrating press SN is complemented with the application of a treatment substance with the help of a belt 36. The applicator belt  
35      36 moves as an endless loop about the roll of the calibrating press SN and the applicator device S2 is arranged to apply surface size to the belt. The surface

size is transferred to the web surface in the calibrating press nip through which the applicator belt and the transfer belt 32 are adapted to pass. As the web passing through the nip has the applicator belt on its one side and the transfer belt on its other side, the function of the calibrating press may be controlled by a proper selection of the belt materials and, particularly, their hardness. In the embodiment shown in FIG. 6, the calendering effect has been augmented still further by using a shoe press as the calibrating press SN. The use of a shoe press also offers excellent facilities to the linear nip pressure profile control in the machine direction, thus allowing the thickness of a product being manufactured to be adjusted within a given smoothness of the web surface.

In FIG. 7 is shown an embodiment in which surface sizing is performed at the web-forming wire section, wherein the first dewatering step is performed. Herein, the solids content of the web is still very low. The web enters the treatment device transported by a dryer wire 2 of the paper- or boardmaking machine. On the dryer wire 2, the web is dewatered and its solids content increases. Still transported by the dryer wire, the web enters the shoe press formed by a shoe roll 40 and a backing roll 41. The dryer wire 2 passes over the backing roll 41 and the transfer belt 39 passes over the shoe roll 40. Thus, the web passes through the shoe press 40, 41 in the nip between the drying wire 2 and the transfer belt 39, whereby the water removal from the web takes place in the direction of the wire 2. In front of the nip formed between the drying wire 2 and the transfer belt 39, there is adapted a spray applicator device suitable for applying a web treatment substance to the web surface. As the web strength due to its high moisture content is low before it enters the shoe press, spray application is a particularly advantageous method of application in this

embodiment.

Next, the web is taken to a second press which advantageously is a shoe press as in the illustrated embodiment. The transfer belt 39 of the first shoe press 40, 41 travels over a shoe roll 42 of the second shoe press thus passing the web into the press nip. A backing roll 43 is adapted to press against the shoe roll 42 and a felt 44 passes over the backing roll 43. Also in this nip, water is removed from the web and the water removal takes place in the direction of the felt 44. Next, the web is passed supported by the transfer belt 39 onto a wire or felt 46. The web is adhered to the felt 46 with the help of a suction roll 45 mounted at the tangential meeting point of the transfer belt 39 with the felt 46. Depending on the paper or board grade to be produced, the web is next passed to a dryer cylinder group, an assembly of the kind described above for treating the other side of the web or to some other type of web treatment apparatus.

In addition to those described above, the invention may have alternative embodiments.

Obviously, the above-described embodiments may be modified in a plurality of ways. Particularly, the number and location of spray applicators may be varied as required from those illustrated herein. Instead of spray application, it is also possible to use so-called jet application, wherein a jet nozzle assembly as wide as the entire web width to be coated is used for ejecting a freely discharged jet of the treatment substance. As the jet applicator discharges the coating in a uniform jet free from droplet formation, the nuisance of coating mist formation is avoided. The jet can be directed to the surface of a belt, roll, web or directly into a nip. In the spirit of the invention, however, it is essential that a treatment substance is applied in at least one

transfer-belt-supported nip to that side of a web which faces the impervious belt. Preferred, the nip should have a impervious belt on the coated side of the web and a felt permeable to water on its other side. The pressing force in the nip may be imposed either by means of rolls or, most advantageously, using a shoe press. This kind of nip achieves efficient water removal from the web and simultaneously subjects the web surface to application or calendering.

The web treatment substance such as a coating mix or surface size may also be applied to the surface of the transfer belt using, e.g., applicator devices similar to those employed in the film-transfer application technique. E.g., the assemblies elucidated in the exemplifying embodiments may also be modified by having a plurality of surface treatment and dewatering stations arranged to operate in-line so that the transfer belt is alternately facing the opposite sides of the web. The invention is also adaptable to multilayer application, wherein at least one coating or web treatment layer is applied using the method according to the invention.

Although the technique according to the invention is most advantageously implemented without having any unsupported passages in the machinery so that the web is at all times passed supported by at least one endless loop of a support element, a roll or a cylinder, it is possible in some special arrangements to transfer the web over an unsupported passage or supporting the passage by air jets to the next support element. An air-impingement dryer, infrared dryer or the like may be used when so desired for drying the web after its treatment while the web is still travelling supported on a belt or felt, before the web enters the next nip and before the treated side of the web becomes the supported side of the web or prior to the entry of the web into the dryer section. While the

- composition and state of the web treatment substance do not directly affect the function of the method according to the invention, they may require the use of certain types of applicator apparatuses or changes in the physical layout of the machinery. The web treatment substance may be in the form of a liquid, solution, dispersion, emulsion or foam, or any other kind of substance which is sufficiently easy to meter and apply.
- 10 The methods according to the invention may be complemented with coat weight measurement performed while the web is still supported on the belt or wire. Obviously, measurement equipment that operate from both sides of the web are unsuitable. One applicable technique for measuring the base sheet solids content and the coat weight, for instance, is the x-ray fluorescence method when  $\text{CaCO}_3$  pigments are used. Any conventional technique of basis weight and moisture content measurement may then be combined with the x-ray fluorescence method, whereby a number of quality variables can be computed from the measurement data thus obtained.

What is claimed is:

1. Method for treating a moving web in a paper- or boardmaking machine, wherein

5

- forming a web on a moving wire,

- removing water from the web by pressing,

10

- drying the web by means of at least one dryer cylinder, and

- subjecting the web to surface treatment by means of at least one technique prior to the first dryer cylinder,

15

c h a r a c t e r i z e d i n t h a t

20

- arranging the web to travel supported by a transfer belt impervious to water during at least one treatment step prior to said first dryer cylinder.

25

2. Method according to claim 1, c h a r a c t e r i z e d i n t h a t a web treatment substance is applied to the web surface during at least one treatment step prior to the first dryer cylinder and the web is arranged to travel supported by a transfer belt (9) so that the side of the web to which the treatment substance is applied is facing the transfer belt (9), whereby the treatment substance is pressed by means of the transfer belt onto the web.

30

35

3. Method according to claim 1, c h a r a c t e r i z e d i n t h a t at least one side of the web is calendered against a transfer belt.

4. Method according to claim 1, c h a r a c t e r -

i z e d in that the web is subjected to a surface treatment while its solids content is in the range of 10 - 60 %.

- 5     5. Method according to claim 1, 2 or 3, c h a r a c -  
t e r i z e d in that the web is dewatered in at least  
one step by pressing the web with the help of an endless  
felt (14) against the transfer belt (9) by means of press  
element (13).
- 10     6. Method according to claim 5, c h a r a c t e r -  
i z e d in that the web is pressed by a felt (14)  
against the transfer belt (9) in a shoe press (13).
- 15     7. Method according to claim 5, c h a r a c t e r -  
i z e d in that the web is pressed by a felt (14) by  
pressing it against a transfer belt (9) by a roll (12).
- 20     8. Method according to claim 1, c h a r a c t e r -  
i z e d in that the web is dewatered by means of a  
noncontacting dryer prior to the first dryer cylinder.
9. Method according to claim 1, c h a r a c t e r -  
i z e d in that the web is being conveyed at least when  
25     it is dewatered under pressing in a continuous contact  
with at least one endless support element such as a wire,  
felt or transfer belt
- 30     10. Method according to claim 1 or 2, c h a r a c -  
t e r i z e d in that the web treatment substance is  
applied to the surface of the transfer belt (9) by means  
of a film-transfer applicator device, spray applicator,  
jet applicator or short-dwell applicator, whereby the  
treatment substance is applied to the web as a film which  
35     travels on the surface of the transfer belt (9).
11. Method according to claim 1 or 9, c h a r a c -

t e r i z e d in that the web treatment substance is applied in at least one step directly to the web surface by means of a spray applicator (S1A, S2).

- 5     12. Method according to claim 1 or 9, c h a r a c -  
t e r i z e d in that the web treatment substance is applied directly into the nip defined between the transfer belt and the web.
- 10    13. Method according to claim 1 or 12, c h a r a c -  
t e r i z e d in that the web treatment substance is applied to the transfer belt and when necessary also directly to the web by an amount that forms a pond into the contact angle between the web and the transfer belt.
- 15     14. Method according to claim 1, c h a r a c t e r -  
i z e d in that the web is treated in a calibrating press prior to passing the web to the first dryer cylinder.
- 20     15. Method according to claim 14, c h a r a c t e r -  
i z e d in that the transfer belt (32) is adapted to pass through the nip of the calibrating press (SN).
- 25     16. Method according to claim 14 or 15, c h a r a c -  
t e r i z e d in that the web is treated in a calibrating press having its nip defined between two rolls (20, 21), wherein the treatment substance is applied to one roll (21) of the calibrating press by  
30     means of an applicator device (S2) and the treatment substance is subsequently transferred from the surface of the roll (21) to the web.
- 35     17. Method according to claim 15, c h a r a c t e r -  
i z e d in that the web is treated in a calibrating press (SN) having a nip defined between two rolls (20, 21) and a belt (36) adapted to run about one roll (21),

wherein the treatment substance is applied to the surface of the belt of the calibrating press by means of an applicator device (S2) and the treatment substance is subsequently transferred from the surface of the belt (36) to the web.

18. Method according to claim 15, c h a r a c t e r - i z e d in that the web is treated in a calibrating press (SN) having its nip defined between a roll (21) and a shoe roll (37) having a belt (36) adapted to run about the roll (21), wherein the treatment substance is applied to the surface of the belt (36) of the calibrating press by means of an applicator device (S2) and the treatment substance is subsequently transferred from the surface of the belt (36) to the web.

19. Method according to claim 2, c h a r a c t e r - i z e d in that the web is adapted to pass through a nip defined between two transfer belts (32, 36) pressable against each other, wherein the treatment substance is applied to the surfaces of both belts (32, 36) and the treatment substance is subsequently transferred to both surfaces of the web.

20. Method according to claim 1, c h a r a c t e r - i z e d in that the web during a dewatering step performed by pressing is supported at least partially by of a felt, belt, roll, cylinder or air blow/vacuum support means.

21. Method according to any one of claims 1, 8 - 20, c h a r a c t e r i z e d in that the web is dried after the application of a treatment substance during the first treatment step by means of a noncontacting dryer such as a radiant heat dryer or air-impingement dryer.

22. Method according to any one of claims 1, 10 - 21,

characterized in that at least two layers of treatment substance are applied at least to one side of the web during at least two separate web treatment steps.

- 5 23. Method according to any one of claims 1, 10, 22, characterized in that at least one layer of a web treatment substance is applied to the web by means of a film-transfer roll (21).
- 10 24. Method according to claim 1, characterized by using a web treatment substance comprising surface size or coating mix in the form of a liquid, dispersion, emulsion or foam.
- 15 25. Method according to claim 1, characterized in that the web is pressed against a roll by means of a transfer belt (9).
- 20 26. Assembly for a paper- or boardmaking machine, the assembly comprising
- a wire section (2, 3) for forming a moving web of paper or board,
- 25 - dryer means (4 - 14) for removing water from the web by pressing,
- at least one dryer cylinder (1) for drying the web, and
- 30 - at least one surface treatment device (S1A, S1B or SN) for treating the surface of the web prior to the first dryer cylinder (1),
- 35 characterized by
- at least one transfer belt (9) that is impervious

to water forming an endless loop against which the web is arranged to travel during a surface treatment step.

- 5 27. Assembly according to claim 26, c h a r a c t e r -  
i z e d by means (S1A, S1B) for applying a treatment  
substance to the web surface facing a transfer belt (9)  
in a manner that causes the applied substance to be  
pressed into the web by means of said belt (9).
- 10 28. Assembly according to claim 26 or 27, c h a r a c -  
t e r i z e d in that at least one of a surface  
treatment devices is a calender.
- 15 29. Assembly according to claim 26, c h a r a c t e r -  
i z e d by
- a felt (14) adapted to travel against said  
transfer belt (9) so that the web to be treated is  
20 passed between the felt (14) and the transfer belt  
(9), and
  - at least one pressing means (13) for pressing the  
felt (14) against the transfer belt (9) for removing  
25 water from the web by pressing.
- 30 30. Assembly according to claim 29, c h a r a c t e r -  
i z e d in that said pressing means is a shoe press  
(13).
31. Assembly according to claim 29, c h a r a c t e r -  
i z e d in that said pressing means is a roll (12).
- 35 32. Assembly according to claim 27, c h a r a c t e r -  
i z e d by at least one noncontacting dryer means used  
for drying the web prior to the first dryer cylinder.

33. Assembly according to claim 26, c h a r a c t e r -  
i z e d by at least one felt (4), wire or belt (9) and  
means (5) for picking the web off from a web-forming wire  
(2) and passing the same supported by at least one felt  
5 (4), wire or belt to the next belt (9), felt or wire.

34. Assembly according to claim 33, c h a r a c t e r -  
i z e d by a wire (15) of a group (1) of dryer cylinders  
and means (16) for picking the web off from said transfer  
10 belt and passing the web at least partially supported by  
said wire via said dryer cylinders (1).

35. Assembly according to claim 34, c h a r a c t e r -  
i z e d by at least one felt (4) and at least one  
15 transfer belt (9) for passing the web in a continuously  
supported manner and in continuous connection with said  
endless loop support means through a pressing dewatering  
step.

36. Assembly according to claim 26, c h a r a c t e r -  
i z e d by means for applying a web treatment substance  
to the surface of the transfer belt, whereby said means  
may comprise a film-transfer applicator, spray applica-  
tor, jet applicator or short-dwell applicator device.  
25

37. Assembly according to claim 26, c h a r a c t e r -  
i z e d by at least one spray applicator device (S1A)  
located within the area of the pressing dryer means for  
applying a web treatment substance directly to the web or  
30 into the nip defined between the web and the transfer  
belt.

38. Assembly according to claim 26, c h a r a c t e r -  
i z e d by a calibrating press (SN) located in front of  
35 the dryer cylinders (1) or a calender through which the  
web is adapted to pass.

39. Assembly according to claim 38, c h a r a c t e r -  
i z e d in that the transfer belt (9) is adapted to pass  
through the calibrating press.

5 40. Assembly according to claim 39, c h a r a c t e r -  
i z e d by means (S2B) for applying a web treatment  
substance on a roll (21) located on the exterior side of  
the endless-loop transfer belt (9) of the calibrating  
press (SN).

10

41. Assembly according to claim 38 or 39, c h a r a c -  
t e r i z e d by a belt (36) adapted to pass as an  
endless loop over said roll (21) located on the exterior  
side of the endless-loop transfer belt (9) and by means  
15 (S2) for applying a web treatment substance on the  
surface of said belt (36).

42. Assembly according to claim 41, c h a r a c t e r -  
i z e d in that said calibrating press (SN) comprises a  
shoe press (37).  
20

43. Assembly according to claim 26, c h a r a c t e r -  
i z e d by

- 25 - at least two transfer belts (32, 36) adapted to  
move at least a portion of their travel opposed to  
each other so that the web is passed therebetween,
- 30 - means (S1, S2) for applying a web treatment  
substance to the surfaces of the belts (32, 36), and
- means (20, 21) for pressing said belts (32, 36)  
against each other for setting up an application  
pressure.

35

44. Assembly according to any one of claims 26, 36, 37,  
40, 43, c h a r a c t e r i z e d by at least one

noncontacting dryer such as a radiant heat dryer or air-impingement dryer serving to dry the web after the application of a web treatment substance.

5     45. Assembly according to claim 26, c h a r a c t e r -  
i z e d by at least one film-transfer roll (21) for  
applying a web treatment substance to the web surface.

10     46. Assembly according to claim 26, c h a r a c t e r -  
i z e d in that at least one transfer belt is adapted to  
pass over the roll in a manner permitting the web to be  
pressed by means of the transfer belt against the roll.
